Control Flow Graphs

CFGs do not map well to variation graphs

Some properties of CFGs

- distinct *start* and *end* vertices
- directed

Inspired by ideas in compiler theory (Johnson et al. 1994), we developed

- an algorithm (SimpleCycleEquiv) and,
- a tool (povu).

- 3 Variant Calling
- 4 Untangling Repetitive Regions

Pangenome Representation - Sequence Tube Map

Sequence Tube Map

Definitions

Definitions are hard, so we shall avoid them today.

You can't just define man as
"featherless bipeds"! I mean look at
this chicken I just plucked! Does this
featherless biped look like a man to you?!

THINK PLATO THINK!

Bidirected and Biedged Graph

Bidirected Graph

Each edge (vertex) has two sides

Biedged Graph

Split each vertex into two; connect them with a black edge.
Previous edges are grey edges.

Flubble

We shall use flubbles as we would bubbles.

(a)

(b)

Trees

A type of graph which may not have cycles.
There can only exist one path between any two nodes.

Properties:

- nodes have a parent-child relationship
- single root node
- have leaves

Trees

Pangenome Variation Structure Tree (PVST)

H	0.0.3	.	.
D	0	.	1,2
F	1	>1>4	.
F	2	>4>13	3,4
F	3	>5>8	.
F	4	>9>12	.

.flb format

Pangenome Variation Structure Tree

We denote using T_v

Properties:

- a rooted tree with root a dummy vertex.
- Its non-root vertices correspond exactly to the flubbles.
- Parent-child edges in T_v represent the nesting relation between flubbles
- Flubbles are non-overlapping

Hairpin Inversion

1-edge-disconnectable. A kind of structural variation, i.e. affects ≥ 50 bp.

Summary/Too Long Didn't Listen (TLDL)

- Decompose the graph into non-overlapping regions
- Call variants on the leaves
- Decomposition algorithm is conceptually simple

Encoding Allele Traversal

How we encode allele traversal in povu.

- 0 no traversal
- 1 traverse in forward orientation
- 2 traverse in reverse orientation

Linear Projection

- **Allele Traversal:** An *uninterrupted* sequence of steps that a reference takes from the start to the end of a single RoV
- **Itinerary:** A sequence of allele traversals for a reference in a single RoV.

subtext: in an itinerary, the sequence of steps is interrupted

Alignment at the Node Level

Alignment at any level lower than that of allele traversal

Context is important for untangling.

Alignment at the Level of Allele Traversals

Summary/Too Long Didn't Listen (TLDL)

- unroll and align
